Introduction

### Introduction

◆□▶ ◆□▶ ◆ ≧▶ ◆ ≧▶ ≧ のへで 2/58

### About the Paper

*Efficient space-filling and non-collapsing sequential design strategies for simulation-based modeling* (2011) by K. Crombecq, E. Laermans, T. Dhaene.

- Comparison and analysis of different space-filling sequential design methods
  - Three novel methods created by authors
  - Several other state-of-the-art methods from other authors

- All methods compared on a set of examples
- Advantages and disadvantages discussed

#### Low-level introduction

Ford Motor Company car crash simulator

• 36 to 160 hours for a single instance Important to make simulators **faster** 

◆□ ▶ ◆□ ▶ ◆ 三 ▶ ◆ 三 ▶ ○ ○ ○ ○ 4/58

Simulation assumptions:

System under study is a black box

◆□ ▶ ◆□ ▶ ◆ 三 ▶ ◆ 三 ▶ ○ ○ ○ ○ ○ 5/58

- ② Simulator is deterministic
  - Determinisitic noise

# Global surrogate modeling

#### Loosely,

- Find approximation function  $\tilde{f}$  that
  - 1 mimics f
  - **2** can be evaluated much faster than f

Mathematically,

- Simulator: unknown function  $f: \mathbb{R}^d \to \mathbb{C}$
- f is sampled at  $P = \{\mathbf{p}_1, \mathbf{p}_2, \dots, \mathbf{p}_n\} \subset [-1, 1]^d$ 
  - Function values  $\{f(\mathbf{p}_1), f(\mathbf{p}_2), \dots, f(\mathbf{p}_n)\}$  are known
- Choose  $\tilde{f}:\mathbb{R}^d\to\mathbb{C}$  from possibly infinite set of candidate approximation functions
- (Write down f,  $\tilde{f}$ , P)

### Global surrogate modeling

◆□ → ◆□ → ◆ = → ◆ = → ○ へ · 7/58

# Experimental Design

How to choose data points P (aka experimental design)?

- Important to success of surrogate modeling task
- Choose data points that capture most information about f

◆□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ <

• Difficult! Little is known about f in advance

**Efficient** *space-filling and non-collapsing sequential* **design strategies for simulation-based modeling** 

### Sequential design

< □ ▶ < □ ▶ < 三 ▶ < 三 ▶ 三 の < ⊙ 10/58

### Why sequential design?

Traditional design of experiments (DoE)

**(**) Choose *P* based only on info available before first simulation

- Peed P to simulator
- **3** Build  $\tilde{f}$

### Why sequential design?

Deterministic computer experiments

• Replication, randomization, and blocking lose their relevance

- Leaves space-filling designs as the only interesting option
  - Cover domain as equally as possible

# Why sequential design?

#### Sequential design (aka adaptive sampling)

- Transforms "one-shot" traditional algorithm into iterative process
- Why iterate?
  - Sequentially gain more information about *f* before choosing next design points
    - Explore more interesting areas
    - Allocate design points to difficult-to-approximate areas
  - No need to choose no. design points ahead of time

#### Why sequential design?

### Important criteria for experimental designs

< □ ▶ < □ ▶ < 三 ▶ < 三 ▶ Ξ ∽ Q (~ 15/58

### What makes a good experimental design?

- Granularity
- Space-filling
- Son-collapsing (good projective properties)

### Granularity

Granularity of a strategy

• Refers to number of points selected during each iteration of algorithm

- Coarse-grained sequential design strategy
  - Large number of points selected
- Fine-grained sequential design strategy
  - Small (preferably one) number of points selected

### Granularity

#### Why is fine-grained prefered?

- Avoids over- or undersampling
  - Don't know ahead of time how many design points to pick

・ロト (日) (三) (三) (三) (18/58)

- Computation time might run out!
  - Punch card days

### Space-filling

What is a space-filling design?

- Intuitively, points are spread out evenly over design space
- Mathematically, select design P to maximize criterion
  - Several space-filling criteria have been proposed
    - E.g. Manhattan, Maximin, Audze-Eglais, Centered  $L_2$  discrepancy,  $\phi_p$

- Choose one (or combination) of criteria
- Maximin space-filling criterion used in this paper

What is a maximin space-filling criterion?

- Maximize smallest L<sub>2</sub> distance between any two points in design
  - $\bullet$  I.e. maximize  $\textit{min}_{p_i,p_j \in \mathcal{P}} || p_i p_j ||_2$

From now on,  $min_{\mathbf{p}_i,\mathbf{p}_i \in P} ||\mathbf{p}_i - \mathbf{p}_j||_2$  refered to as *intersite distance* 

### Non-collapsing

What is a design that has good projective properties? (Also called the **non-collapsing** property.)

- When design is projected from *d*-dim space to (d-1)-dim space along one of the axes, no two points are ever projected onto each other
  - I.e. for every point  $\mathbf{p}_i$ , each value of  $p_i^k$  is strictly unique

#### Non-collapsing

◆□ → ◆□ → ◆ Ξ → ▲ Ξ → ● Ξ → ⑦ < ℃ 22/58</p>

Existing methods

# Existing methods

< □ ▶ < □ ▶ < 三 ▶ < 三 ▶ 三 ∽ Q (~ 23/58

### Some existing methods

To be used as benchmarks:

- Factorial designs
- 2 Latin hypercube
- Output Sequences
- Remaining methods

Design space is hypercube  $[-1, 1]^d$ 

・ロ · ・ (日 · ・ ミ · ・ ミ · の へ C<sup>\*</sup> 24/58

### Factorial designs

What is a full factorial design (factorial)?

- Construction
  - Grid of  $m^d$  points
- Automatic advantages
  - Largest intersite distance among all designs

・ロ · ・ (日 · ・ ミ · ・ ミ · の へ C<sup>25/58</sup>

- Disadvantages
  - Horrible projective properties

#### Factorial designs

# Latin hypercube

#### What is a Latin hypercube design (LHD)?

- Construction
  - Divide each dimension in *m* equally sized intervals
  - Place exactly one point in each interval for each dimension
- Automatic advantages
  - Largest projective distance among all methods
  - Any two points are at least  $\frac{2}{m}\sqrt{2}$  distance away
- Achtung!
  - Can have bad space-filling properties
  - Constructing a good space-filling LHD is non-trivial
    - Can take 100+ hours in d = 3 setting
- Three LHD generation methods used
  - lhd-joseph
  - lhd-matlab
  - lhd-optimal (available for certain combos of dims and pts)

#### Latin hypercube

Low-discrepancy sequences

What does low-discrepancy mean?

• A set of points *P* has a low discrepancy if the number of points from the dataset falling into an arbitrary subset of the design space is close to proportional to a particular measure of size for this subset

#### Low-discrepancy sequences

What is a low-discrepancy sequence?

- Sequences of points such that for each *n*, the points  $\{x_1, x_2, \dots, x_n\}$  have a low discrepancy
- Advantages
  - Popular sequences have good projective properties

- Disadvantages
  - For small n, bad space-filling properties
- Two low-discrepancy sequences used
  - Halton
  - Sobol

# Remaining methods

Three other methods to be used

- Methods from Crombecq et al. (2009)
  - delaunay
    - Computes delaunay triangulation of samples
    - Selects new sample in center of gravity of simplex with largest volume
  - 🝳 voronoi
    - Estimates Voronoi tessellation of samples
    - Selects new sample in largest Voronoi cell
  - I random sampling
    - Base case
- Fine-grained
- Optimize toward intersite distance
- Neglect projective distance

### New space-filling sequential design methods

・ ・ ・ ・ ● ・ ・ = ・ ・ = ・ つへで 32/58

### Introduction

Goal:

• Score well on space-filling and non-collapsing criteria

• Fine-grained as possible

### Introduction

New methods

Sequential nested Latin hypercubes

- I Global Monte Carlo methods
- Optimization-based methods

# Sequential nested Latin hypercubes

#### How to "sequentialize" LHD (lhd-nested)?

- Repeat:
  - Grid of candidate (initially  $m^d$ ) points
  - 2 Iteratively choose new samples (initially m) on grid
    - Chosen point lies farthest away from all previously selected points

### Sequential nested Latin hypercubes

### Global Monte Carlo methods

Monte Carlo methods in sequential design

Generate large number of random candidate points

- Occupie Compute criterion for all these points
- Select point with the highest score on criterion

### Global Monte Carlo methods

First MC criterion used: mc-intersite-proj

- Aggregate of intersite and projected distance
- Want to score candidate design  $P' = P \cup \mathbf{p}$ 
  - P is previously evaluated samples
  - **p** is new candidate point
- Score of P' is

$$\begin{split} \texttt{intersite} &- \texttt{proj}(P, \mathbf{p}) = \frac{\sqrt[d]{n+1}-1}{2} \min_{\mathbf{p}_i \in P} ||\mathbf{p}_i - \mathbf{p}||_2 \\ &+ \frac{n+1}{2} \min_{\mathbf{p}_i \in P} ||\mathbf{p}_i - \mathbf{p}||_{-\infty} \end{split}$$

### Global Monte Carlo methods

Second MC criterion used: mc-intersite-proj-th

- Still use intersite and projected distance
- Instead, use projected distance as threshold function
  - Discard points that lie too close (projected) to other points
- Threshold (minimum allowed projected distance) is d<sub>min</sub> = <sup>2α</sup>/<sub>n</sub>
  α is tolerance parameter
- Score of P' is

$$\begin{split} \texttt{intersite} &-\texttt{proj} - \texttt{th}(P, \mathbf{p}) = \min_{\mathbf{p}_i \in P} ||\mathbf{p}_i - \mathbf{p}||_2 \\ &\times \mathbf{1}_{\{\min_{\mathbf{p}_i \in P} ||\mathbf{p}_i - \mathbf{p}||_{-\infty} \geq d_{min}\}} \end{split}$$

•  $\alpha = 0.5$  chosen (tradeoff)

#### Global Monte Carlo methods

**か**へで 40/58

# Optimization-based methods

First optimization-based criterion used: optimizer-proj

- Ind 30 points with large minimum intersite distance
- Wiggle points to maximize minimum projected distance  $(\beta = 0.3 \text{ chosen})$
- Select point with largest minimum projected distance

#### Algorithm 1. The optimizer-proj algorithm

 $\begin{array}{l} P_{candidates} \leftarrow 100n \text{ random points} \\ P_{new} \leftarrow 30 \text{ best points using intersite distance} \\ \textbf{for all } \textbf{p_{new}} \in P_{new} \textbf{ do} \\ m(\textbf{p_{new}}) \leftarrow min_{\textbf{p} \in P} \| \textbf{ p_{new}} - \textbf{p} \|_2 \\ d_{max} \leftarrow \frac{\beta m(\textbf{p_{new}})}{2} \\ \text{Optimize } \textbf{p_{new}} \text{ towards } \|P \cup \textbf{p_{new}}\|_{-\infty} \text{ on } [\textbf{p_{new}} - d_{max}, \\ \textbf{p_{new}} + d_{max}] \\ \textbf{end for} \end{array}$ 

#### Optimization-based methods

### Optimization-based methods

Second optimization-based criterion used: optimizer-intersite

- Similar to optimizer-proj
- Pirst rank by minimum projected distance
- **③** Then wiggle ( $\alpha = 0.5$  chosen) to maximize minimum intersite distance

#### Results

### Results

< □ ▶ < **□** ▶ < Ξ ▶ < Ξ ▶ Ξ の Q @ 44/58

# Summary of methods

Methods (12 total)

- Existing non-sequential methods

  - 2 voronoi
  - 🗿 delaunay
  - 🕘 random
  - 🗿 halton
  - 🗿 sobol
- Novel sequential methods
  - 1 mc-intersite-proj
  - 2 mc-intersite-proj-th
  - optimizer-intersite
  - 🕘 optimizer-proj

### **Test Particulars**

- Methods used to generate 144 points for d = 2, 3, and 4
- 15 min max run time
- Each method in each dimension run 30 times to get std dev estimate
- Methods compared on three criteria
  - Granularity (no. points added per iteration)
  - Space-filling (intersite distance)
  - In Non-collapsing (projected distance)
- Each novel method has best possible granularity
- Sequential methods expected to perform worse than one-shot methods
  - One-shot methods assume total no. points known beforehand

### Results

#### Some important observations

- d = 2: Compare lhd-optimal to factorial
- d = 2: Difference between mc-intersite-proj and mc-intersite-proj-th

- d = 2, 3, 4: Compare optimizer-intersite to lhd-optimal
  - d = 2: Performs 21% worse
  - d = 3: Performs 16% worse
  - *d* = 4: Performs 8% worse
    - 15 min vs 6 h

#### Results for d = 2 (intersite distance)

### Results for d = 2 (projected distance)

#### Results for d = 3 (intersite distance)

**か**へで <sub>50/58</sub>

### Results for d = 3 (projected distance)

#### Results for d = 4 (intersite distance)

# Results for d = 4 (projected distance)

Conclusions

### Conclusions

< □ ▶ < □ ▶ < 三 ▶ < 三 ▶ 三 ∽ Q (~ 54/58)

# Summary of Results

- New methods perform close to pre-optimized LHD (and much faster)
- Of new methods, best are optimizer-intersite and mc-intersite-proj-th
  - optimizer-intersite possibly unfeasible in higher dimensions
  - mc-intersite-proj-th easy to implement, fast, performs well in all dimensions
