## Letter Recognition

Bautista, Dianne Carrol
Chen, Hongshu
Paul, Rajib
Jun 8 ${ }^{\text {th }}, 2004$

## Outline

- Intióoduction
, Preliminary analysis
, Results \& Discussions
$-1-\mathrm{NN}$
- LDA
- SVM
- Conclusions

## Intifoduction

, Multi-Class Recognition Problem
, Objective:
to classify each of a large number of black and white rectangular pixel displays as one of the 26 Capital letters of the English alphabet.

## Dalta Description

」 Soulice: David Slate (Jan 1991)
Odesta Corporation, Evanston, IL 60201
, Size: 20,000 (obs) $\times 17$ (variables)
, Details:
-based on 20 different fonts
-representing five different stroke styles--simplex, duplex, triplex, complex, and Gothic -and six different letter styles--block, script, italic, English, German, and Italian.

## Generation of Character Images

, caills made to a character-image generating program with uniformly distributed parameter values for font type, letter of the alphabet, linear magnification, aspect ratio, and horizontal \& vertical warp
, charracter image represented in terms of the vector coordinates of the end-points of its constituent line segments Warping was applied to these coordinates line segments were then converted to raster format forming a rectangular array of pixels, each of which was "on" or "off" The totality of "on" pixels represented the image of the desired character

- average dimension of the arrays was 45 pixels high by 45 pixels wide

## Sample Images

## Atturibute Information

, Each image associated with a vector of 16 numerical attributes
, numerical attributes scaled to fit into a range of integer values from 0-15 attributes represent primitive statistical features of pixel distribution

## Sample Image and Pixel Distribution

## Frequency Distribution of Letters

## Exploratory Cluster

Clusters of Letters

## Performance Measures

, Sensitivity (S1)

$$
\begin{aligned}
\text { S11 } & =P\left\{X==^{\prime} A^{\prime} \mid Y=^{\prime} A^{\prime}\right\} \\
& =P\left\{X=A^{\prime} A^{\prime} \cap Y==^{\prime} A^{\prime}\right\} / P\left\{Y=^{\prime} A^{\prime}\right\}
\end{aligned}
$$

Specificity ( S 2 )

$$
\begin{aligned}
S 2 & =P\left\{Y=' A^{\prime} \mid X=^{\prime} A^{\prime}\right\} \\
& =P\left\{X==^{\prime} A^{\prime} \cap Y=^{\prime} A^{\prime}\right\} / P\left\{X=^{\prime} A^{\prime}\right\}
\end{aligned}
$$

## 1 Nearest Neighbor

- Entails retaining all elements of the training set in memory and using them to classify each member of the testing set
, 0 determine the class of a member in the testing set, its Euclidean distance from each member in the memory is calculated.
- It is then assigned the same classification as the classification of the member it is nearest to

## 1 Nearest Neighbor

, Use the randperm function in matlab to create training and testing sets
, Traing -16000
Testing-4000
Code the 1-NN algorithm in matlab

- Run 12 experiments

## 1 Nearest Neighbor

$\checkmark$ Average success rate: 95.81\%
, Consistency (standard deviation): 0.13\%
, Acceptable low error rates
, High sensitivity

- High specificity

## 1 Nearest Neighbor

Worst Error Rate Statistics

| Letter | Mean | STD | Minn | Max |
| :--- | :--- | :--- | :--- | :--- |
| H | 10.43 | 3.15 | 5.67 | 16.54 |
| K | 8.73 | 2.94 | 3.97 | 14.46 |
| B | 7.47 | 2.53 | 4.83 | 13.84 |
| R | 7.03 | 2.60 | 3.57 | 11.25 |
| E | 6.45 | 1.67 | 4.29 | 11.03 |
| F | 6.12 | 1.93 | 2.84 | 9.35 |

## 1 Nearest Neighbor

Best Error Rate Statistics

| Letter | Mean | STID | Min | Max |
| :--- | :--- | :--- | :--- | :--- |
| $A$ | 0.79 | 0.84 | 0.00 | 2.12 |
| $Z$ | 1.47 | 0.98 | 0.00 | 3.10 |
| $Y$ | 2.17 | 0.91 | 0.69 | 3.68 |
| $M$ | 2.18 | 1.13 | 1.16 | 4.90 |
| $S$ | 2.20 | 0.87 | 0.71 | 3.59 |
| $Q$ | 2.84 | 0.87 | 1.27 | 4.09 |
| $V$ | 3.26 | 1.26 | 0.63 | 4.97 |

## 1 Nearest Neighbor

, We also investigated what is the nature of misclassification,
, For example, the misclassification rate of "D" as "R" is 2.22\%
And the misclassification rate of "F" as "P" is $2.75 \%$ etc

## 1 Nearest Neighbor

, As aitifibutes are quantized from $0 \sim 15$, so we have situation of ties
In the case of tie, we choose the first class Percentage of Error Due to Ties

$$
\begin{array}{lllllllllllll}
\hline \text { Expt \#: } 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 \\
\hline \text { \%of } & & & & & & & & & & & \\
\text { error } & 27.1 & 26.4 & 22.4 & 28.1 & 26.8 & 22.4 & 29.1 & 20.6 & 23.3 & 21.5 & 28.1 & 20.7
\end{array}
$$

## Linear Discriminant Analysis

, Let Pr(G|X) be the posterior of classification given attribute $X$
, $f_{k}(X)=$ conditional density of $X$ given $G=k$
, $\Pi_{k}=$ prior probability of class $k$
By Bayes theorem

$$
\operatorname{Pr}(G=k \mid X=x)=f_{k}(x) \cdot \Pi_{k} / \Sigma_{l} f_{1}(x) \cdot n_{l}
$$

## Linear Discriminant Analysis

- LDA assumes
$f_{k}(\mathbf{x})=\left(1 /(2 \pi) p / 2\left|\boldsymbol{\Sigma}_{\mathbf{k}}\right|^{1 / 2}\right) \exp \left\{-1_{2}\left(\mathbf{x}-\boldsymbol{\mu}_{\boldsymbol{k}}\right)^{\top} \boldsymbol{\Sigma}_{\mathbf{k}}{ }^{-1}\left(\mathbf{x}-\boldsymbol{\mu}_{\boldsymbol{k}}\right)\right\}$
, So the logarithm of the posterior probability is

$$
\log \{\operatorname{Pr}(G=\mathrm{K} \mid \mathrm{X}=\mathrm{x})\}=-5^{*} \log \left\{\left(1 /(2 \pi)^{p \mid}\left|\Sigma_{k}\right|\right)\right\}
$$

- LDA classifies based on the logarithm of the posterior probability

## Linear Discriminant Analysis

, We coded the LDA in $R$
Average success rate: $69.88 \%$
, Consistency (standard deviation): $0.21 \%$
Worst Classified

| Letter | Average accuracy |
| :---: | :---: |
| s | 44.3 |
| E | 45.6 |
| G | 46.8 |
| H | 46.9 |
| S | 50.1 |
| Y |  |

## Linear Discriminant Analysis

## Best Classified

| Letters | Average accuracy |
| :---: | :---: |
| A | 85.8 |
| M | 88.6 |
| V | 85.4 |
| W | 85.9 |

## Linear Discriminant Analysis

, Naiture of misclassification
JThe misclassification rate of "E" as "G" is $10,9 \%$
, The misclassification rate of " $\mathrm{G}^{\prime}$ as " $\mathrm{C}^{\prime}$ is $18 \%$

- The misclassification rate of " $\mathrm{H}^{\prime \prime}$ as " K " is 8.1\%

## Support Vector Machines

, SVM is a classification method to maximize the margin between two classes $\{-1,1\}$

$\xi_{i} \geq 0, y_{i}\left(\beta \cdot \phi\left(x_{i}\right)+\beta_{0}\right) \geq 1-\xi_{i} \forall i$

- Decision rule

$$
\hat{y}_{i}=\operatorname{sgn}\left(\beta \cdot \phi\left(x_{i}\right)+\beta_{0}\right)
$$

## Support Vector Machines

, For Multu Classes ( $k=1,2 \ldots, n$ )

- Solve one optimization problem
- Combining several SVMs for binary classifications
- One-against-all: $n$ SVMs
- One-against-one: $n(n-1) / 2$ SVMs
- DAG

## Support Vector Machines

- LIBSVM: one-against-one
- Success rate: 97.98\%
, OSU SVM: matlab toolbox for LIBSVM
-Does not work for our problem: 16\%
SVM toolbox by Dr. Schwaighofer
- Error-Correcting Output Codes

## Support Vector Machines

, ECOC

## Support Vector Machines

, Best Classified: $A, S, U, Z, T$
, Worst Classified: $D, B, K, R, H$
, Some misclassification patterns in confusion matrix: P \& F; I \& J; B \& S \& R

## Support Vector Machines

Clusters of Letters

## Findings

- 1. 1-NN and SVM gave higher sensitivity and specificity, compared with the LDA. The difference in both measures is at least 15\%
, 2. 1-NN and SVM showed faster learning rates compared with LDA. We note however that LDA's accuracy ( $70 \%$ ) did not significantly change when the training set was reduced from 16,000 to 1,600 .

## Findings

- 3. In terms of classification errors, 1-NN and SVM algorithms produce similar misclassification patterns in their respective confusion matrices.

4. The most computing intensive method is SVM, and least is LDA.
5. The OSU-SVM Toolbox (Ahalt, Ma,\&, Zhao,2002) may need code modification as it did not work for this particular data set.

## Limitation

-methods treated all sixteen attributes equally.
-relationships between the features to determine plausibility of dimension reduction was not fully explored.
(e.g., elimination, linear or non-linear combinations of some features)

## Next Steps

, Consider different types of boosting to improve the performance of 1-Nearest Neighbor.
b. Distance metrics, other than Euclidean, may be explored for the nearest-neighbor algorithm.

## Next Steps:

, c. Optimize the parameters of the SVM ECOC.
, Also try using different ECOC tables.
, d. In view of recent developments, explore hybrid methods which combine the advantages of statistical and non-statistical algorithms. For example, doing a tree-based method and a multiple logistic regression.
